1. Starting the test server

1) Open NetworkTestServer application using the link from start menu:

2) After application starts, you may want to adjust test session settings:

   **Data size** specifies how many bytes are send along test packet.
   **Packet count** specifies how many packets are sent during test session.
   **Delay** is the interval time (in milliseconds) in which packets are sent.

3) Select network adapter on which server will be listening and click on **Start server** button.

   **Note:** You may be prompted by windows firewall to allow program access to the network.

   **Note:** Both test server and iMan should be connected to the same network.
2. Connecting to test the server

1) Open NetworkTestClient application using the link on the iMan Menu:

![iMan Menu](image)

2) Select network adapter which will be used to connect to server and check server’s IP address which need to be the same as in NetworkTestServer application:

![Network Test Client](image)

3) You can check if there is connection between server and client by clicking on Test connection button.
4) Click on **Start test** button to begin testing session. Both server and client application will show test progress:
